

Wednesday Challenge Form

Group Members: Krish, Derek, Andrew, William

Problem Statement: Would you rather write all the numbers from one to a million instead of taking math class for the school year and skip all the normal math class tests, quizzes, etcetera and get an A for the year, or would you rather take the normal math class for the year.

Approach: We decided that we would write out all the numbers. We figured this by dividing 1000000 by 240, the approximate number of school days, including weekends. After getting that answer, we divided that number by 7, and then 60, to get the number of numbers we would need to write a minute, which was 69. This is a large amount, but you can always do extra on the weekends.

Solution: David's group won because of their very well detailed explanation.

Lessons Learned: We should have explained and written our calculations more easily.
